AgriFlow Foods

Power BI Executive Control Tower — Build Reference

1. Model

- Dimensions: Farms, Products, Warehouses, Carriers, Customers, Date.
- Facts: Harvest Lots, Quality Inspections, Inbound Shipments, Inventory Lot Status, Customer Orders, Outbound Shipments, Weather, Market Prices, Procurement Contracts.
- Bridge: Lot Allocations connects customer orders back to harvest lots.
- Preserve lot_id as a traceability key; do not aggregate it away in the model.

2. Page 1 — Executive Control Tower

- Cards: procurement spend, quality rejection, inbound loss, spoilage value, fill rate, OTIF, forecast WAPE.
- Loss waterfall from source quality through customer rejection.
- Monthly trend + top intervention callouts.

3. Page 2 — Farm & Supplier Performance

- Supplier score, yield attainment, grade/reject rate, pesticide compliance, PPV.
- Region/certification/irrigation cuts.
- High-spend high-risk supplier table.

4. Page 3 — Inbound Logistics & Cold Chain

- Carrier score, delay, freight/kg, loss rate and temperature excursion.
- Storage-class and carrier drilldowns.

5. Page 4 — Inventory / Shelf Life / FEFO

- Ageing buckets, days-to-expiry, spoilage value, critical lots.
- Warehouse/product exception queue.

6. Page 5 — Demand & S&OP

- Actual vs forecast, WAPE, safety stock and reorder point.
- Overlay perishability/shelf life to avoid overstocking fresh products.

7. Page 6 — Customer Service & Margin

- Fill, OTIF, customer rejection, unfilled-sales proxy, landed-cost/gross-margin outputs.

8. Page 7 — Traceability & Recall

- Lot selector → source farm → warehouse → impacted orders/customers.
- Recall exposure quantity and sales value.

9. DAX Starter Layer

Use `05_PowerBI/01_DAX_Measures.dax` as the starter metric layer. Add a proper Date table before time-intelligence measures and use solution CSV outputs for forecasting/safety-stock pages if you do not rebuild those models inside Power BI.
